zapVIEW
search & data processing

What is...

ZapView is a real time search and data processing global system, fully supported on web technologies. ZapView can connect to different data sources and perform simple and advanced searches. It also extracts knowledge in real time analysis from all the indexed data of the connected systems.

Functionalities

- Global search on all connected systems: databases, web crawler, file system and web services

- Indexing large volumes of information in any format

- Global search on all connected systems including file content

- OCR engines to search images

- Providing search services for invocation from external systems

- Several user profiles and permissions management

- Indicators and reporting on all indexed data types and performed searches

- Web Crawling com notificações e actualizações automáticas

The information you need at the right time.
***ZapView, a step ahead.***
